The light-duty vehicle fleet is expected to undergo substantial technological changes over the next several decades. New powertrain designs, alternative fuels, advanced materials and significant changes to the vehicle body are being driven by increasingly stringent fuel economy and greenhouse gas emission standards. By the end of the next decade, cars and light-duty trucks will be more fuel efficient, weigh less, emit less air pollutants, have more safety features, and will be more expensive to purchase relative to current vehicles. Though the gasoline-powered spark ignition engine will continue to be the dominant powertrain configuration even through 2030, such vehicles will be equipped with advanced technologies, materials, electronics and controls, and aerodynamics. And by 2030, the deployment of alternative methods to propel and fuel vehicles and alternative modes of transportation, including autonomous vehicles, will be well underway. What are these new technologies - how will they work, and will some technologies be more effective than others? Written to inform The United States Department of Transportation's National Highway Traffic Safety Administration (NHTSA) and Environmental Protection Agency (EPA) Corporate Average Fuel Economy (CAFE) and greenhouse gas (GHG) emission standards, this new report from the National Research Council is a technical evaluation of costs, benefits, and implementation issues of fuel reduction technologies for next-generation light-duty vehicles. Cost, Effectiveness, and Deployment of Fuel Economy Technologies for Light-Duty Vehicles estimates the cost, potential efficiency improvements, and barriers to commercial deployment of technologies that might be employed from 2020 to 2030. This report describes these promising technologies and makes recommendations for their inclusion on the list of technologies applicable for the 2017-2025 CAFE standards.

Drawing on the innovative concept of Organizational IQ and a study of companies in seventeen countries, Survival of the Smartest charts a course for managers to follow into the twenty first century. At the heart of the book is the authors' assessment tool of an organization's future health, which they call Organizational IQ. It measures a company's ability to quickly process information and make effective decisions. As industry clockspeeds accelerate everywhere, a high IQ has become a prerequisite for survival. Low IQ companies that the authors studied, on the other hand, have already vanished. Case studies from Hewlett-Packard, British Petroleum, Sun Microsystems and Chrysler, among others, illustrate how companies can improve their Organizational IQ. How did Hewlett-Packard become the dominant player in printing? How did British Petroleum transform itself from a stodgy behemoth into the most agile and competitive player in the oil industry? How did Chrysler rise from the brink of bankruptcy to become the auto industry's prized asset? In these companies, technology by itself only played a secondary role; to be successful, the entire organization had to become smarter. The authors show how key strategic decisions turned around these companies' Organizational IQ-and with it, their fortunes. A detailed company case study takes you in slow motion through the different steps you can take to improve the IQ or you own organization. Survival of the Smartest offers a rare blend of a coherent framework, in-depth company case studies, a sound research base, and a detailed, step-by-step implementation example. Based on a landmark study of 164 organizations worldwide, conducted as part of a partnership between Stanford University, McKinsey & Company and the University of Augsburg, Organizational IQ is proving to be the acid test for the success or failure of companies around the world. Haim Mendelson, PhD, is the James Irwin Miller Professor of Information Systems at the Stanford Business School, leader of the Technology, Organizations, and Markets area at the Stanford Computer Industry Project, co-director of the Stanford Executive Program on Strategic Uses of Information Technology, and a consultant to leading high-tech firms and financial institutions. Johannes Ziegler, PhD, is the cofounder of Synesis Management Consulting. Synesis helps senior executives in leading high-tech companies, including Hewlett-Packard, Cisco, 3Com, and Intuit, to measure and improve their Organizational IQs. Before founding Synesis, Dr. Ziegler was a consultant with McKinsey & Company.

Why do smart and experienced leaders make flawed, even catastrophic, decisions? Why do people keep believing they have made the right choice, even with the disastrous result staring them in the face? And how can you be sure you're making the right decision—without the benefit of hindsight? Sydney Finkelstein, Jo Whitehead, and Andrew Campbell show how the usually beneficial processes of the human mind can become traps when we face big decisions. The authors show how the shortcuts our brains have learned to take over millennia of evolution can derail our decision making. Think Again offers a powerful model for making better decisions, describing the key red flags to watch for and detailing the decision-making safeguards we need. Using examples from business, politics, and history, Think Again deconstructs bad decisions, as they unfolded in real time, to show how you can avoid the same fate.
