In power electronics the converters such as dual converter, cycloconverter and so on are designed using thyristors and can be controlled using a control mechanism such as firing angle control. A triac can be defined as two thyristors connected in anti-parallel direction and having only one gate terminal.

Recent work in the field of electrical machines has led to the development of a new type of electric motor that is energy efficient, electronically controlled and of a low cost to manufacture, with the intention to make OEM manufacturers aware of an alternative to the world's reliance on inefficient single phase induction motors.

In electrical engineering, electric machine is a general term for machines using electromagnetic forces, such as electric motors, electric generators, and others. They are electromechanical energy converters: an electric motor converts electricity to mechanical power while an electric generator converts mechanical power to electricity. The moving parts in a machine can be rotating or linear. Besides motors and generators, a third category often included is

Electric machine - Wikipedia

In electrical machines, either input or output or both can be electricity. Types of Electrical Machines. The electric machines are of three main types, transformer, generator, and motor. Electrical Transformer: In the transformer, both input and output are electrical power. Electrical Generator: In a generator, the input is mechanical power and the output is electrical power. Electrical Motor: In a motor, the input is electrical power and output is mechanical power.

As the name indicated, these machines use electric power - the needle of electric sewing machines is controlled by a single motor. The pressure applied on the foot peddle will control the stitching speed. These machines usually have more choices for stitches and have additional features such as buttonholers and automatic bobbin winders.
