Relation between Heat transfer and Fluid Mechanics: So heat transfer occurs in three modes, Conduction; Convection; Radiation; In three of these conduction and convection, mainly convection is related to fluid mechanics. Convection is mode of heat transfer from a solid layer to adjacent liquid or gas layer. It involves the combined effect of Conduction and Fluid Motion. Greater the value of bulk motion of fluid, greater the rate of heat transfer(convection).

Newton's Law of Motion applied to Fluid Elements: $F = m [u_2 - u_1]$ Newton's Third Law Applied to Pipe: This is the force acting on the fluid and only means to apply the force on the fluid is the walls of the pipe. Hence, from Newton's third law, and equation and opposite force will act on the pipe. ??
 $X = m * [u_{2X} - u_{1X}] = F ?X.$

An Introduction to Fluid Flow, Heat Transfer, and Mass Transport The subject of transport phenomena describes the transport of momentum, energy, and mass in the form of mathematical relations [1] . The basis for these descriptions is found in the laws for conservation of momentum, energy, and mass in combination with the constitutive relations that describe the fluxes of the conserved quantities [2] .

Thermofluids is a branch of science and engineering encompassing four intersecting fields: Heat transfer Thermodynamics Fluid mechanics Combustion The term is a combination of "thermo", referring to heat, and "fluids", which refers to liquids, gases and vapors. Temperature, pressure, equations of state, and transport laws all play an important role in thermofluid problems. Phase transition and chemical reactions may also be important in a thermofluid context. The subject is sometimes also referr
