Marine biology and ecology research The Marine Biology and Ecology Research Centre addresses a broad range of research questions, from the effects of environmental stress on microbes and developing embryos to the management of large scale impacts, such as global climate change. Its research is divided into six broad research themes:

'Marine Conservation Biology' brings together leading experts from around the world to apply the lessons and thinking of conservation biology to marine issues. The contributors cover what is threatening marine biodiversity and what humans can do to recover the biological integrity of the world's oceans.

Humans are terrestrial animals, and our capacity to see and understand the importance and vulnerability of life in the sea has trailed our growing ability to harm it. While conservation biologists are working to address environmental problems humans have created on land, loss of marine biodiversity, including extinctions and habitat degradation,

has received much less attention. At the same time, marine sciences such as oceanography and fisheries biology have largely ignored issues of conservation. Marine Conservation Biology brings together for the first time in a single volume leading experts from around the world to apply the lessons and thinking of conservation biology to marine issues. Contributors including James M. Acheson, Louis W. Botsford, James T. Carlton, Kristina Gjerde, Selina S. Heppell, Ransom A. Myers, Julia K. Parrish, Stephen R. Palumbi, and Daniel Pauly offer penetrating insights on the nature of marine biodiversity, what threatens it, and what humans can and must do to recover the biological integrity of the world's estuaries, coastal seas, and oceans. Sections examine: distinctive aspects of marine populations and ecosystems; threats to marine biological diversity, singly and in combination; place-based management of marine ecosystems; the often-neglected human dimensions of marine conservation. Marine Conservation Biology breaks new ground by creating the conceptual framework for the new field of marine conservation biology -- the science of protecting, recovering, and sustainably using the living sea. It synthesizes the latest knowledge and ideas from leading thinkers in disciplines ranging from larval biology to sociology, making it a must-read for research and teaching faculty, postdoctoral fellows, and graduate and advanced undergraduate students (who share an interest in bringing

In recent years, citizen science has emerged as a powerful new concept to enable the general public, students, and volunteers to become involved in scientific research. A prime example is in biodiversity conservation, where data collection and monitoring can be greatly enhanced through citizen participation. This is the first book to provide much needed guidance and case studies from marine and coastal conservation. The novelty and rapid expansion of the field has created a demand for the discussion of key issues and the development of best practices. The book demonstrates the utility and feasibility, as well as limitations, of using marine and coastal citizen science for conservation, and by providing critical considerations (i.e. which questions and systems are best suited for citizen science), presents recommendations for best practices for successful marine and coastal citizen science projects. A range of case studies, for example, on monitoring of seabird populations, invasive species, plastics pollution, and the impacts of climate change, from different parts of the world, is included. Also included are discussions on engaging

youth, indigenous communities, and divers and snorkelers as citizen scientists, as well as best practices on communication within citizen science, building trust with stakeholders, and informing marine policy as part of this exciting and empowering way of improving marine and coastal conservation. .

Providing a guide for marine conservation practice, *Marine Conservation* takes a whole-systems approach, covering major advances in marine ecosystem understanding. Its premise is that conservation must be informed by the natural histories of organisms together with the hierarchy of scale-related linkages and ecosystem processes. The authors introduce a broad range of overlapping issues and the conservation mechanisms that have been devised to achieve marine conservation goals. The book provides students and conservation practitioners with a framework for thoughtful, critical thinking in order to incite innovation in the 21st century. "Marine Conservation presents a scholarly but eminently readable case for the necessity of a systems approach to conserving the oceans, combining superb introductions to the science, law and policy frameworks with carefully chosen case studies. This superb volume is a must for anyone interested in marine conservation, from students and practitioners to lay readers and policy-makers." —Simon Levin, George M. Moffett

In 1989, the Center for Marine Conservation (CMC) joined a large group of international organizations in developing a Global Biodiversity Strategy. Now, CMC, the World Conservation Union, World Wildlife Fund, the World Bank, and the United Nations Environment Programmes have assembled a companion document, focusing on threats to life in the sea and ways to save, study, and use that life sustainably. This work, contributed by more than 100 experts, presents the most up-to-date information and views on the challenge of conserving the living sea. Illustrations, tables, figures, index.

"Written for the upper-level undergraduate or graduate-level course, Marine Environmental Biology and Conservation provides an introduction to the environmental and anthropogenic threats facing the world's oceans and outlines the steps that can and should be taken to protect these vital habitats"--

foundations of marine conservation, including the rationale, importance and practicalities of various approaches to marine conservation and management. The scope of the book encompasses an understanding of the elements of marine biodiversity - from global to local levels - threats to marine biodiversity, and the structure and function of marine environments as related to conservation issues. The authors describe the potential approaches, initiatives and various options for conservation, from the genetic to the species, community and ecosystem levels in marine environments. They explore methods for identifying the units of conservation, and the development of defensible frameworks for marine conservation. They describe planning of ecologically integrated conservation strategies, including decision-making on size, boundaries, numbers and connectivity of protected area networks. The book also addresses relationships between fisheries and biodiversity, novel methods for conservation planning in the coastal zone and the evaluation of conservation initiatives.

Coastal-Marine Conservation: Science and Policy introduces students and managers to complex conservation and management issues facing coastal nations of the world, their citizens, and international and non-governmental organizations. It aims to reduce complexity and inspire a greater consensus for more effective conservation action. Presents the

coastal realm as a heterogeneous, diverse ecosystem of exceptional high biological diversity and productivity, and where conservation challenges are most difficult and urgent. Examines the critical issues facing coastal-marine conservation and the mechanisms for dealing with them. Reviews the basic science required for addressing conservation issues by presenting the coastal realm as a land-sea ecosystem of global significance, and by reviewing the natural-history features of coastal-marine organisms. Presents three ecologically and latitudinally distinct "real-world" case studies to create a context for understanding of regional systems, their cultures, and their conservation: the polar Bering Sea, the temperate Chesapeake Bay, and the tropical Bahamas. Makes apparent the ecological stresses on the coastal realm, increasing rates of ecosystem change, loss of ecosystem health, and fragmented governance. Synthesizes the major challenges for conservation and suggests future policy and management strategies, including ecosystem management and needs for achieving sustainability and addressing the environmental debt. This book is intended for undergraduates and graduates taking courses in coastal and marine conservation and management, as well as those actively engaged in coastal-marine conservation activities, and gives the reader a clear steer to future management approaches. In the last 50 years marine conservation has grown from almost nothing to become a major topic of global activity involving many people and organisations. Marine conservation activities have been applied to a huge diversity of species, habitats, ecosystems and whole seas. Many marine conservation actions have focused on human impacts on the marine environment from development and pollution to the impacts of fisheries. Whilst science has provided the backbone of thinking on marine conservation, perhaps the biggest change over this period has been the use of an ever-increasing range of techniques and disciplines to further marine conservation ends. Bob Earll explores what marine conservation involves in practice by providing a synthesis of the main developments from the viewpoints of 19 leading practitioners and pioneers who have helped shape its progress and successes. Their narratives highlight the diversity and richness of activity, and the realities of delivering marine conservation in practice with reference to a host of projects and case studies. Many of these narratives demonstrate how innovative conservationists have been - often developing novel approaches to problems where little information and

no frameworks exist. The case studies described are based on a wide range of European and international projects. This book takes an in-depth look at the reality of delivering marine conservation in practice, where achieving change is often a complicated process, with barriers to overcome that have nothing to do with science. Marine conservationists will often be working with stakeholders for whom marine conservation is not a priority. This book aims to help readers describe and understand those realities, and shows that successful and inspirational projects can be delivered against the odds.
